

CoinStudio (CS)

Cryptocurrency Trading Apps, Framework & API

The amount of cryptocurrency exchanges are rapidly increasing, each coming with different user experiences. Some exchanges allow a full range of trading features while others only allow market orders. Some are easy-to-use some aren't, making it hard for new people entering cryptos trading altogether.

In addition to this, there are many great tools out there like portfolio managers, alert/signal apps and bots. But similar to exchanges as mentioned above, they all vary a lot in ease-of-use and features. It is hard for people to decide which ones are actually best suited for them.

Developers are facing the same issues, as every exchange provides its own APIs and tools, making it very costly and time-consuming to already cover just a few exchanges.

The crypto community is lacking popular marketplaces to obtain products and services around crypto. There are forums like Bitcointalk where businesses promote their solutions but those are far from the ease-of-use and functionality we know from app stores.

CoinStudio is solving the issues above by acting as an aggregator for exchange APIs, providing a single (opensource) framework that every developer can rely on and enables them to focus on the development on their applications.

CoinStudio also provides its own reference implementations and apps (products) based on its framework and API to earn revenue for further development and plans to release a crypto marketplace where crypto businesses can promote and sell their own products and services.

The first working product is **CoinStudio Lite**, an innovative cryptocurrency price estimation app to help traders keeping their trades in sane boundaries (<https://crosstec.org/coinstudio-promo/>).

CoinStudio Lite is just the beginning and a first working product that interacts with our API. See at the timeframe below what range of products are about to be developed and released.

Each product will be either obtainable by 1-time fees or membership plans, depending on the kind of app, providing the revenue for further growth.

We believe that we are able to lower the barriers for people to join the world of crypto trading and envision CoinStudio to be the top source for trading tools, crypto software and services.

The company behind CoinStudio is a year-long self-funded business and doesn't rely on an ICO in order to operate. This gives us the opportunity not to rush into things and deliver realistic timeframes.

The CS Token

A variety of our planned products will make use of our own crypto asset called **CS** and we will decide in the process in what way it will be distributed.

For the time being, people will already be able to obtain **CS** upon purchasing a **CoinStudio Lite** membership and may use it to get discounts for membership extensions and future CoinStudio products – or just hold it.

We are looking forward to the first exchange listings in the last quarter of 2018.

If you have questions about the **CS Token**, feel free to write us an email info@crosstec.org or join our Discord discussion: <https://discord.gg/ZrQWPNf>

CS Token Specs:

- **Platform:** Ethereum (ERC20)
- **Max. Supply:** 60 Million (fixed)
- **Decimals:** 8
- **Max. Distributed Tokens:** 51%
- **Reserved Tokens:** 49%
- **Initial CS value:** \$0.80 / CS

Why Ethereum?

Ethereum provides all the necessary development tools, maturity and the promise of further development we need to implement features that we want to see in CoinStudio.

From all the platform projects we tested, we came to the conclusion that they are all great but Ethereum being the one that is ahead of the competition.
